Acknowledgment

This study was supported by the American Iron and Steel Institute (AISI) and was conducted under AISI Project 168, entitled, "Toughness Criteria for Structural Steels." The tests of the 10 CT specimens under displacement-control conditions and the follow-up CVN tests on 7 of these specimens were conducted at the Armco Steel Corporation Research Center in Middletown, Ohio, under the direction of D. E. McCabe and R. H. Heyer. The author gratefully acknowledges this vital contribution, as well as the frequent discussions on R-curve technology with Messrs. McCabe and Heyer. Additional frequent discussions with the author's colleague, J. M. Barsom, are also hereby acknowledged. Thanks are also extended to J. F. Sovak for conducting the R-curve tests and making the subsequent calculations. Additional gratitude is also extended to Betty K. Stewart for helpful discussions concerning the application of statistical analysis concepts.
