Subject Index

A

Air permeation test, 848
Air pluviation, 410, 655
Air-water mixture, bulk modulus, back pressure effect, 345
Alluvial clay, 355-356; see also Low plasticity clays
Aluminum, polished platen, 207
Analog-to-digital conversion, 110
Angle of friction, 363
interlocking, 567-568
relation with particle breakage, 689
ultimate, 567
Angle of internal friction, see Friction angle
Angle of shear resistance, 667
Anglian till, 592
description, 593
Anisotropically consolidated undrained tests, 323, 328-332, 334
Anisotropic clays, 819
Anisotropic consolidation, 82, 123-124, 231-232, 264, 732
effective stress, unsaturated soil, 545-546
e-log p curves, 545
loading path, 545
simplified, 276-277
stresses, 391
techniques, 455
Anisotropic preshear consolidation stresses, 423
Anisotropic remolded clay, undrained true triaxial test, 829-831
Anisotropic sand, stress-strain relations, 785
Anisotropy, 7, 421, 766, 796
influence, 767-768
shear-induced, 472
stress-induced, 831
undrained, 450
see also Cross-anisotropy
Antifriction device, 291, 293
Apparatus compressibility, 430
Area correction, 433-435, 715
bulging failure, 716-717
general procedure, 730
shear plane failure, 716-718, 729
ASTM C 109, 409, 411-414, 416
ASTM D 698, 630
ASTM D 854, 613, 630
ASTM D 1586, 629
ASTM D 1587, 629-631, 638, 640
ASTM D 2049, 207, 409
ASTM D 2216, 633
ASTM D 2487, 630, 733
ASTM D 2850, 631, 720, 722, 724
Atchafalaya clay, frequency response, 780
Automated measurements, 7
Automated triaxial testing, 95-106, 143
block diagram of loading system, 97
computer and printer, 99
controller, 96-98
interface unit, 99
loading system components, 98-99
schematic, 97
software, 100-101
test results, 101-106
transducer and signal conditioner, 98
triaxial cell, volume change device, 98
Automatic drained testing rate, 89-90
Axial compression, measurement, 47, 51, 282
Axial correction, 431
Axial deformation
digital indicator, 87
measurements, errors, 260
Axial displacement
cohesionless soils, 44-49
measurement, 225-232
error sources, 226-227
misalignment errors, 227-230
stiffness curve, 225-226
stiffness evaluation, 230-232
pore pressure distributions, 588
Axial load, 845-846
application, 146
measurement, 223-224, 734
Axial rebound, 735
Axial strain, 132, 202
apparent shear strength as function of, 528
bedding error, 695
conversion to rotation of electrolevel capsule, 47, 50
cyclic, versus Poisson’s ratio, 141–142
direct measurement, 493–495
measurement, 134–135, 770–771
peak, test condition effects, 296
pore pressure distributions, 589
versus, 672–673, 675
versus radial strain, 736–737
versus shear stress, 355, 359
versus stress difference and pore pressure change, 346–348
versus stress ratio, 703–704
Young’s modulus effect, 137–138
Axial stress, 378
average, 775
versus conventional and local strain, 491, 494
effective, 37
hydraulic triaxial apparatus, 55
independent stress control apparatus, 844
pore pressure distributions, 589

B
Back pressure
application, 275–276
bulk modulus effect, 345
consolidation, 391
saturation by, 246–248, 436–437
Banding sand, 643–644
Bedding error, 436, 486
correction, 491
cyclic triaxial test, 492
drained compression triaxial tests, 292
embankment dams, 491–493
lubricated ends, 695
Bellofram seal, 55
Bender element
before and after excitation voltage, 285
initial shear modulus from, 284–287
mounted in triaxial pedestal, 285
piezoceramic, 284–285
Bifurcation, 604, 611
Biologic activity, contaminated soils, 400
Biot’s theory of consolidation, 583–585
Biot’s theory of poro-elasticity, 582–583
Bivariate beta distribution
chi-square goodness-of-fit test, 556–559
discretized x-y domain, 557
Q-R domain, 557–558
Bivariate beta modeling, parameters c and t, 561, 563–565
Bivariate distributions, 553, 559
Block samples, 630
Boulder clay
shear strength, 530–531
triaxial compression test, partially saturated soils, 529–530
Boundary condition, 692, 706
flexible, 757–759
isotropy, 796–797
mixed rigid and flexible, 757
rigid, 756–757
surface friction, 756
Boundary-material interactions, 743–744
Boyle’s law, 208, 342
Brittle fracture, 169
Bulk modulus, air-water mixture, back pressure effect, 345
Burette method, 202, 850–851
Bushing, designs, 433
C
Calcareous sand, 290
Calcareous soil, 363
CALIB, 100
Cambria sand, 707
Cambridge true triaxial apparatus, 796–805
description, 797–800
plane-strain tests, 813
platen arrangement, 797
sample preparation, 800–801
stepper motors, 797–799
strain path, used to prepare one-dimensionally compressed samples, 800–801
variation with time of principal stresses and strains, 801–802
Cap
free horizontal movement, 698, 700–702
rotation, end conditions, 696–698
tilting angle, 697, 699
Castor oil, 281
Cavitation, 240
Cell fluid, 189
deaired water as, 192
glycerin as, 194
Cell pressure
elevated, 290, 298–299
initial, application, 274–275
Cemented soil, 363
CK, U test programs, 447–448
strength ratio, 452–453
CK,U triaxial compression, 455–456
Clayey soil, 501, 503
Clays, 387, 512, 667, 796
comparison of undisturbed and disturbed specimens, 268–269
consolidation paths, 253–255
constant rate of strain hydrostatic compression, 128
e-log p relation, 504–505
extrusion, 235
flow-pump-permeability and coefficient-of-consolidation data, 73–75
geotechnical characteristics, 196
grain size accumulation curves, 502
heavily overconsolidated specimens, 271–274
filter paper, 272
specimen height, 271–274
stress paths, 278–279
initial effective stress measurement, 243
Ko consolidation and rebound, 129
normally and slightly overconsolidated specimens
specimen mounting, 274
stress paths, 277–278
physical properties, 502
preconsolidation stress, 266–267
reconsolidation, 253, 255
sample disturbance, 266, 268
shear strains, 232–233
stress-dilatancy relation, 509
stress-strain relation, 506–508
under cyclic loading, 768
volumetric strain, 265–266
see also Low plasticity clays
Coarse particles effect, embankment dams, 498–499
Coefficient of compressibility, 547–548
versus void ratio, 543
Coefficient of consolidation, 68
response time and, 74–79
Coefficient of permeability, consolidation, 672, 674
Cohesion, 363
apparent, 523
Cohesionless soils, 7–62, 567–581, 692
angle of internal friction, 11, 18–19
automated strain and stress control, 54–61
axial displacement, 44–49
conversion of axial strain to rotation of electrolevel capsule, 47, 50
diagram of triaxial apparatus, 36
differential hydraulic stress path control system, 54–55
effective stress path, 22, 24–26, 28, 30
end lubrication, 42
effective stress, 580
frequency-independence of deformation properties, 46–47
grain size effect on peak strength, 577
gravel content, 579–580
horizontal displacement, 49, 51–52
hysteresis loop, 45–46
laboratory shear testing methods classification, 12–17
laboratory strength testing, 8–30
load measurement, 38–40
location stud embedded in sample, 52
normalized strength difference versus percent dilatation, 576
o versus shear distortion, 29
parallel gradation curves, 569–570
percent dilatation, 575
percent fine content, 571
relationship with maximum grain size, 569, 571
slope of normalized strength difference lines versus, 577–578
percent gravel, sand, and fine content by weight, 570–571
pressure measurement, 35–38
principal stress directions, 11
continuous rotation, 29, 62
reconstituted specimens, 240–242
shear strength components, 567
grain effect, 568–569
shear stress versus o, 23, 27–28
slope of best fit lines, 577
stress conditions, sample preparation, 40–41
stress corrections, 41–42
stress path, 29
stress-strain curves, 573
stress-void ratio curves, 573
suction, 233
test material, 570–571
two-component load cell, 35
undisturbed frozen and unfrozen samples, 242
volume change, 49, 51–54
weighing system with electronic balance, 52
see also Triaxial cell
Cohesive soils, 353
compacted, pore water pressure, 513
conventional triaxial test, 421–422
effective stress
drying effects, 237–238
factors affecting, 234
Cohesive soils—Continued
pore pressure gradients, 236–238
specimen preparation, 235–236
water exchange
specimen and filter paper, 238–239
specimen and membrane, 238
water imbibed from pore pressure, 239–
240

Collar-coupled load design concept, 147
Combination hydraulic-pneumatic loading
system, 119–131
anisotropic $K_0$ consolidation, 128–129
apparatus description, 119–122
consolidation, 122–124
constant rate of strain hydrostatic con­
solidation, 128
cyclic loading, 127
constant stress ratio anisotropic consol­
idation, 128
compaction, 169–187
cohesive soils, pore pressure, 513
compaction characteristics, 172–173
compression test, 172, 179–182
description, 172
failure zones, 184
shear strength law, 183
suction-water content relationship, 173–
175
see also Tensile strength
Compaction, 642
equal-volume method, 644–645
methods, reconstituted sand specimens, 405
molds, 391
relationships, Vicksburg buckshot clay, 519
tests, 512
Compatibility equation, 777, 794
Compliance, 68, 70–71
Compressibility, 68
apparatus, 430
latex disks, 493
values, 78–79
very small strain, 72–73
Compression tests, 124, 202
compacted soils, 172, 179–182
shear strength, 268
see also Multistage compression tests
Compression theory, 720–721
Computer controlled hydraulic triaxial test­
ing system, 82–94
automatic drained testing rate, 89–
90
axial deformation digital indicator, 87
cyclic loading tests, 92
data presentation, 90
digital controller, 86–87
extension device, 84–86
extension tests, 93
features, 93–94
$K_0$ consolidation, 89
layout, 82–83
pore pressure measuring system, 87
stress path testing, 91–92
test control, 88
triaxial cell, 82–84
Computer system, deformation measure­
ment, 206
Concrete, cyclic tests, 812–813
Confining pressure
effective, 36, 658
initial, membrane correction, 719–720
Consolidated drained test, 424–426
Consolidated isotropic undrained compres­
sion test, lateral filter drains, 198
Consolidated tests, 219
Consolidated undrained shear, 667
Consolidated undrained test, 424–426
Consolidation, 107, 189, 219, 264
anisotropic, see Anisotropic consolida­
tion
back pressure, 391
Biot’s theory, 583–585
coefficient of permeability, 672, 674
combination hydraulic-pneumatic load­
ing system, 122–124
filter paper effects, 194–199
filter paper efficiency, 200
increment duration, 284
isotropic, 314
pore pressure dissipation, 671–672
shallow samples of normally consoli­
dated soil, 279
to high stress, 471–472
two-stage, 800
water content versus effective pressure,
670–672
with and without lateral filter drains, 196–197
Consolidation path
clays, 253–255
effects on stress-strain behavior, 255, 257
sands, 255, 257–259
Consolidation pressure, effective, versus
undrained shear strength, 676
Consolidation states
SHANSEP method, 469–470
soil behavior, 466–467
Consolidation stress, effective, Young’s
modulus effect, 137
Consolidation stress path
highly overconsolidated clays, 278–279
lightly overconsolidated clays, 277–278
Consolidation tests, 512
Constant-head permeability tests, 74
Constant-rate-of-deformation consolidation,
flow pump applications, 71–72
Constant rate of strain hydrostatic consolidation, 128
Constant strain-rate triaxial tests, 582
Constant volume cyclic simple shear aparatus, 21
Constitutive equations, 766
hollow cylinder torsional devices, 779–784
Constitutive laws, 834
Constitutive model, shear band formation,
608–612
Contaminated soils, 387–403
biologic activity, 400
differential consolidation, 394–395
diffusion through membrane, 398–400
effective stress, as function of hydraulic conductivity, 393
equipment, 389–390
gradient, as function of hydraulic conductivity, 391–393
health and safety considerations, 401
influent equilibrium, 396–398
maintaining saturation, 395–396
materials, 388–389
particle migration, 393–395
permeant, 389
pore volume displacement, 398–399
procedure, 390–391
shear strength, 400
test duration, 392
testing at low gradients, 400
type of water, 400
Contamination resistance, 389
Conventional triaxial compression, 203
100-cycle, 213–214
Conventional triaxial test, 363, 501
cohesive soils, 421–422
Corrections, 421
Crack propagation, hollow cylinder torsional devices, 787
Creep, 107
rate, versus isotropic stress, 304, 306
station, major components, 166
Critical state, 592
theory, 169, 469
Cross-anisotropy, 9, 706
axis of symmetry, 9–10
Cubical devices, 743–763
actual boundary surface conditions, 755–759
all flexible, 749–752, 752
all rigid, 747–748
alternative perfect surface conditions, 745–747
boundary-material interactions, 743–744
capabilities, 745–746
directional shear cell, 752–755
mixed rigid and flexible, 749
needed developments, 760, 762
proving apparatus performance, 755
specimen homogeneity, 744
stress-strain data, 759–763
uses of data, 744–745
Cyclic behavior, 859
Cyclic compression-tension tests, membrane-piston cell, 813
Cyclic loading, 82, 119, 121–122, 264
clays, 768
combination hydraulic-pneumatic loading system, 127
dense sand, 92
stress loading, followed by monotonic strain-controlled undrained loading, 130–131
Cyclic strain-controlled testing, 475–484
deviator vertical load, versus pore pressure, 482
intact and reconstituted specimens, 479–480
interpretation of results, 479–483
pore pressure model, 481–483, 484
procedure, 477–479
residual pore pressure in reconstituted specimens of sands, 481
sands tested, 476–477
testing configuration layout, 479
triaxial cell, 478
Cyclic tests, 280–283
bedding effect, 492
Cyclic tests—Continued
membrane-piston cell, 812
shear, deformation properties, 46–47
Cyclic torsional shear tests
apparatus, load-controlled, 47, 49
quasistatic, 47–48
Cyclic undrained tests, 32–33, 280–283
Cyclic undrained torsional shear tests, 21–22
Cylindrical specimens, advantages and limitations of triaxial test, 221–223

D
Damage propagation, hollow cylinder torsional devices, 787
Damping ratio
at large strain, 783
versus strain, 781
Darcy’s law, 153
Data acquisition, 167
Decay model, 75–76
Deformation
false, 284
localization, 861, 863–864
Deformation measurement, 202–215, 438
computer system, 206
data capture and reduction, 205–207
device, 809–810
gap sensor method, 854–855
end restraint, 854–855
strain distribution, 855–856
interstitial membrane penetration, 212
linear variable differential transformer, 204–205
mean pressure versus volumetric strain, 211
no-contact gap sensors, 848–852
noncontact devices, 204
Q’ versus vertical strain, 209–210
sample preparation-back saturation, 207–209
strain gauges, 203–204
volumetric strain, versus ε, 209, 211
Deformation modulus, embankment dams, 490, 493
Deformation properties, frequency-independent, 47
Dense sand
cyclic loading test, 92
cyclic undrained triaxial tests, 280–283
Densification, sand, 412
Density, 405
Deviatoric strain, 803–804
Deviatoric strain path, 802–803, 866–867
Deviatoric stress, 333–334, 727
Kuwaiti soils, 371, 373
plane, 862
removal, 734
true triaxial testing cell, 825
vectors, 830–831
versus strain curves, 358, 360
Deviatoric stress path, 802–803
Differential consolidation, contaminated soils, 394–395
Differential hydraulic stress path control system, 54–55
Differential pressure, 36
transducer
liquid-liquid, 35–37
low capacity, 35, 39, 49, 51, 56
Digital controller, 82, 86–87
Dilatancy, 679

evolution with mean pressure, 307
test condition effects, 297
Dilation, 706
rate
at failure, 680
peak strength, 684
Directional shear cell, 752–755
daisy chain shear sheets, 754
directional verification, 760–761
distribution of principal strain magnitudes and directions, 756
specimen corner, 757, 759
Direct shear test, failure law, 466
Direct tensile apparatus, 806
Displacement-controlled loading frame, 252–253
Drained compression tests, 382
bedding error, 292
don restraint, 291
lubricated end platens and slenderness ratio, 291–292
strength parameters, 292
volumetric strain, 382, 385
Drained constant strain-rate test, pore pressure distributions, 585–590
Drained cyclic straining simple shear test, 11, 20
Drained extension test, 379
Drained fine sand, 202
Drained monotonic compression test, stress control, 101, 103
Drained monotonic extension test, stress control, 101, 103
Drained monotonic shear loading, 125–127
Drained simple shear test, 11, 20
Drained stress path controlled shear, 129–130
sand, 130
Drained triaxial testing, 363
stress path, 423–424
Drammen clay
end friction and height/diameter ratio effect, 271–273
sample disturbance effect, 266, 268
Ductility, defined, 178
Dynamic loading, 132, 475

Effective stress, unsaturated soil, 539–552
anisotropic consolidation test, 545–546
constant suction, 547–549
failure stresses, 543–545
isotropic compression test, 542–543
specimen preparation, 541
test apparatus, 540–541
tests performed, 542
variable suction, 549–551
volumetric strain, 550
Elastic behavior, 132, 790–791
Elastoplastic behavior, unsaturated soil, 550
Electrical resistivity, 143
Electrolevel gauges, 50
Electronic transducers, 7
Electropneumatic transducer, 121–122
e-log $p$ curves
anisotropic consolidation testing, 545
clay, 504–505
Shirasu, 505
Embarkment dams, 486–500
axial strain, direct measurement, 493–495
bedding effect, 491–493
coarse particles effect, 498–499
constant mean pressure triaxial compression tests, 498–499
deformation modulus, 490, 493
extension tests, 497–498
frictionless ends, 492–493
Grand-Maison Dam, 488–489
membrane penetration, 495–496
objectives of program, 488, 491
Vieux-Pré Dam, 486–487
End conditions, 692–704
cap rotation, 696–698
free horizontal movement of cap, 698, 700–702
friction angle, 693

versus void ratio, 694–696, 698, 701–702
kinematic condition effects, 696–702
lubricated ends, sample slenderness effects, 702–704
stress ratio, versus axial strain, 703–704
stress-strain curves, 695–697
with and without free horizontal movement of cap, 700–701
surface condition effects, 694–696
test conditions, 693
test program, 694
types, 694
End friction, reduction, 271
cohesionless soils, 42
comparison with frictional ends, 441

boulder clay, 529–530
consolidated-drained, 515–516
constant water content, 516–517
failure envelope, 523
laboratory investigation, 516–517
laboratory testing equipment, 517–518
literature review, 512–516
saturated tests, 522–524
soil and specimen preparation, 518–519
unsaturated tests, 524–527
plastic hardening modulus, 609
sand, 659–661
Seto sand, 851, 853
shear band formation, 615
specimen preparation, 613–614
stress path, 615–617
stress-strain curves, 615, 619–621
Triaxial compression strength, compared with plane strain compressive strength, 660
Triaxial creep cell, 157
Triaxial extension test, 82, 376–385, 655
axial stress, 378
connections, 229–230
critical condition, 624
cylindrical specimens, 222
equipment, 380
failure envelope, 381–382
plastic hardening modulus, 610
sand, 661–662
shear band formation, 615, 618–619
specimen models, 378–379
specimen preparation, 379–380, 613–614
strength parameters, 381–382
stress path, 615–617
stress-strain curves, 615, 618, 622–623
Triaxial permeability testing, long-term, variables, 402–403
Triaxial plane, 222
Triaxial shear tests, error evaluation, 423, 426–427
Triaxial testing, sources of problems, 427–429
Trimming, 264
True triaxial test, see Multiaxial test

U

Ultimate strength, 567
Unconsolidated undrained test, 169, 219, 248–250
effective stress paths, 225, 249
error, 466
limitations, 220, 250
shear stress causing strain equalization, 230, 232
shortcomings, 248–249
unsafe strengths, 453–454
Unconsolidated undrained compression test, multistage, 355–356, 358–359
Undrained compression test, 592–602
equipment and instrumentation, 594
laboratory tests, 593–595
pore pressure, 595–602
reconstituted specimens, 595
reference section, 598–599
shear stresses versus axial strains, 355, 359
Undrained creep tests, 281
Undrained cyclic loading test, constant $P$, 105–106
Undrained extension test, stress-strain relationships, 674–675
Undrained monotonic compression test, stress and strain control, 101–102, 104
Undrained monotonic extension test, strain control, 102, 104
Undrained monotonic shear loading, 124–125
Undrained shear behavior, filter paper, shape, 675–678
Undrained strength, 421
Undrained triaxial test, 363
in situ undrained strength ratios, 452–453
mode of shearing, 450–452
rate of shearing, 449–450
recompression technique, 448
role in engineering practice, 454–455
sample disturbance, 447–448
Unsaturated soil, 512
compaction curves, 541
effective stress, see Effective stress, unsaturated soil
elastoplastic behavior, 550
extended Mohr-Coulomb strength relationship, 514–515
triaxial test apparatus, 540
Unsaturated triaxial test specimens, shear strength, 524–526

Vertical strain, versus shear stress, 354–356
Vicksburg buckshot clay, 519–521
Vieux-Pré Dam, 486–487
axial stress, 491, 494
stress path, 489
stress-strain volume, 490, 492–493

Void ratio
applied stress relationships, 521
critical, 573, 642
height of drop, mass pouring rate and particle size effects, 410–411
particle size and height of drop effects, 409
Reid-Bedford sand, 207
Shirasu, 504
suction relationship, 520–521
Toyoura sand, 504
versus coefficient of compressibility, 543
versus friction angle, 659, 694–696, 698, 701–702

Volume change, 679
cohesionless soils, 49, 51–54
distributions
Fulung sand, 685–686
Ottawa sand, 687
Tamsui River sand, 686
within specimens, 684–686
end restraint, 681
height-to-diameter ratio, 710–712
suction change and, 543
versus stress, 866, 868–869

Volumetric strain, 132
calculation, 146
clays, 265–266
drained compression test, 382, 385
due to membrane penetration, 214
effective stress, unsaturated soil, 550
generated by drained cyclic loading, 138
Kuwaiti soils, 370–371
versus mean pressure, 211
pore pressure distributions, 589–590
reconsolidation, 266, 268
specimens with and without lubricated ends, 684
test condition effects, 294–295, 297
variation with length of stress path, 803–804
versus $\varepsilon$, 209, 211
versus time, isotropic creep tests, 303, 305

Water content
change and suction, 551
changes due to drying, 236–237
changes during reconsolidation, clays, 253
change with monotonic and repeated loading, 543–544
equation, 551
suction change and, 543
versus effective consolidation pressure, 670–672
Water evaporation, rate, 51–52
Water exchange, 238–239
Water migration, 233
Water pluviation, 411–412
WATSALT Laboratory, 155
Wave velocity, 143, 148
Weak rocks, 376
physical properties, 383
strength properties, 381–384
test results, 384
Wheatstone bridge, 38
Withdrawal test, time response, 76, 78
Wykeham Farrance triaxial cell, 314, 366

X-ray attenuation, 298–299

Yield envelopes, 324, 328
Yield functions, 550
Yield surface, Rendulic stress plane, 839
Young's modulus
axial strain effect, 137–138
effective consolidation stress effect, 137
effect of maximum grain size, 140
versus sample diameter, 139
